Disclosures

**Research Grant Support:** Abbvie, BMS, Eisai, Galectin, Genentech-Roche, Genfit, Gilead, Globeimmune, Immuron, Intercept, Merck, NGM, Pfizer, Sundise, Co-Investigator for NIH NCI RO1 Biomarkers for Hepatocellular Carcinoma

**Consultant-Advisor:** Abbvie, BMS, Excalenz, Janssen, Genentech-Roche, Gilead, Globeimmune, HepQuant, HEPATIQ, Immuron, Intercept, Merck

**NIH NIDDK:** Member of DILIN DSMB and Executive Committee of LTCDS

**Speakers’ Bureaus (CME Only):** Chronic Liver Disease Foundation (CLDF), Gastroenterology and Liver Association (GALA), ViralEd
Identification of drugs or biologics with potential to cause serious, life-threatening DILI requires causality assessment and comprehensive testing for alternative etiologies in each suspected case\(^1\).

Since idiosyncratic DILI is rare, prediction of the risk of serious DILI post-marketing relies on identification of cases of interest meeting Hy’s Law criteria during phase II-III clinical trials\(^2\).

Subjects with pre-existing, chronic liver diseases (CLDs), with or without cirrhosis, are challenging because current FDA guidance is based largely on criteria for studies that exclude subjects with abnormal liver tests \(^3\).

CLDs do not increase overall susceptibility for DILI, but multiple exceptions suggest that additional examples will be identified in future clinical trials \(^2\).

DILI in subjects with CLD is worrisome because subjects with reduced hepatic functional reserve are less likely to recover and more likely to die \(^2,3\).

The probability of subjects with CLDs enrolling in clinical trials is increasing, especially in therapeutic trials targeting components of the metabolic syndrome (enriched for NAFLD), antimicrobials, specific CLDs, complications of cirrhosis and hepatocellular carcinoma.

\(^3\) Chalasonai N, et al Gastroenterology 2015; 148: 1340-52
Key Questions:

1. What is the probability of enrolling patients with CLDs, including cirrhotics, in drug development trials?
2. What are the risks of serious DILI and hepatic decompensation in subjects with CLDs?
3. How do protocols currently protect subjects with CLDs, including cirrhotics, from serious DILI?
4. What improvements in protocols can provide greater protection from serious DILI in patients with CLD, including cirrhotics?
   a. Assessment pre-enrollment
   b. Monitoring on treatment
   c. Functional assessment of suspected DILI and stopping rules
Etiologic Spectrum of Chronic Liver Diseases with Risk of Progression to Cirrhosis

Chronic Liver Diseases

- Alcoholic
- Viral Hepatitis
- NAFLD
- Genetic
- Autoimmune
- Drug-Induced
- Pediatric
Probability of Enrolling Americans with CLDs with or without Cirrhosis in Clinical Drug Trials

General Drug Development

- Obesity
- Hyperlipidemia
- DM-2
- Hypertension
- Gout

Selected Population

- ≥50% with NAFLD (Steatosis/NASH)
- + Other CLDs

General Population

- 25-35% Expected to have CLDs
- 5-7% Gilbert

Selected Population

- ≥50% with NAFLD (Steatosis/NASH)
- + Other CLDs
- 5-7% Gilbert
Drugs for specific CLDs
- HBV±HDV, HCV±HIV, HEV
- NAFLD/NASH
- AIH, PBC, PSC
- Genetic

Drugs for Cirrhosis/Complications
- Cirrhosis
- PVHTN
- Varices
- HE
- HCC
- Antifibrotics

Certainty of Enrolling Americans with CLDs with or without Cirrhosis in Clinical Drug Trials
Cirrhosis: Global Prevalence per 100,000 Persons

Alcohol is cause of 47.9% cirrhosis*

Most accurate differentiating F0-1 from F4 cirrhosis
Hy’s Law
Derivation and Current Definition

“Drug-induced hepatocellular jaundice is a serious entity. The mortality rate ranges from 10% to 50%.”

Hy’s Law as defined by FDA¹:
- ALT or AST >3 X ULN (good sensitivity; poor specificity)
- Total bilirubin >2 X ULN (improved specificity)
- No “initial findings of cholestasis (elevated ALP)
- No alternative cause of liver test abnormalities

NIDDK DILIN²:
- ALT >3X ULN
- Total bilirubin >2X ULN
- ALP <2X ULN

Caveats:
- Not a Law but a clinically useful tool!
- Calls for urgent assessment and adjudication
- 2 Case Rule: Finding 2 Hy’s Law cases in a clinical trial is highly predictive of ALF³

    - Acute on Chronic Liver Failure
      - Multi-Organ Failure
      - Sepsis
    - Death
Can Study Protocols Protect Patients with Liver Diseases from Serious DILI?

Key Questions:

1. What is the probability of enrolling patients with CLDs, including cirrhotics, in drug development trials?
2. What are the risks of serious DILI and hepatic decompensation in subjects with CLDs?
3. How do protocols currently protect subjects with CLDs, including cirrhotics, from serious DILI?
4. What improvements in protocols can provide greater protection from serious DILI in patients with CLD, including cirrhotics?
   a. Assessment pre-enrollment
   b. Monitoring on treatment
   c. Functional assessments
   d. Stopping rules
Identification of Study Subjects with CLDs

CLD Present

Test for Etiology

Non-Invasive Testing for Cirrhosis

*NB! Additional testing required to exclude: HBV, HCV, NAFLD, AIH, PBC, PSC, burned out cirrhosis (e.g. ETOH, HBV, AIH), EBV, CMV, SOS, Wilson disease
Risk of Decompensation of Cirrhosis
Gold Standard Fasting HVPG ≥ 10 mm Hg

Hepatic Venous Pressure Gradient (HVPG) = Wedged HV Pressure – Free HV Pressure
Cumulative Proportion of Patients Transitioning from Compensated to Decompensated Cirrhosis

Classification of Study Subjects with Cirrhosis
Surrogate Measures of Hepatic Functional Reserve

Cirrhosis

+ HCC surveillance

Compensated
- CTP 5-6
- D’Amico Stages 1-2
- Preserved Hepatic Function

Mildly Decompensated
- CTP 7-9
- D’Amico Stages 3-4
- ↓ Hepatic Function

Severely Decompensated
- CTP 10-15
- D’Amico Stages 4-5
- ↓↓ Hepatic Function
Quantitative Liver Function Testing
Non-Disease Specific Assessments of Function

**HEPATIQ**
- FDA approved
- $^{99m}$Tc-Liver-Spleen Scan
- Software analysis calculates Perfused Hepatic Mass (PHM)

**HepQuant**
- Not FDA approved
- Analyses of oral and/or iv cholate clearance
- Calculation of Disease Severity Index (DSI) or STAT score

**Excalenz**
- Not FDA approved
- $^{13}$C-Methacetin breath test of $^{13}$C-M to APAP
- Generates PK/PD of $^{13}$CO$_2$
Stopping Rules Using Functional Monitoring for Severe DILI in CLD with or without Cirrhosis

- Serial Symptom Assessment
- Frequent, Serial Liver Tests + PT INR
- Serial eDISH Plotting of ALT and T Bili
- Serial Assessment ALT Stopping Rules

Any Signal of Interest for DILI

Stable Function: Consider Protocols for Observation

Hepatic Functional Reserve
- QLFTs
- Biomarkers of Function

Worsening Function: Discontinue Drug
Concern About DILI in CLD with or without Cirrhosis: A Call to Clinical Action

Urgent Need for:
1. Repeat history and PE
2. Repeat testing to verify
3. Comprehensive testing for etiologies other than DILI
4. Calculate MELD/Na, CTP
5. Repeat QLFTs to detect change in hepatic function
6. More frequent F/U visits, liver tests and QLFTs
7. Adherence to stopping rules
Future Investigative Opportunities in DILI
Host Factors and Drug Properties

- Hepatic Function Testing
- Epidemiology of CLDs in Trials
- Biomarkers:
  - DILI
  - DILI Severity
- Genetics:
  - Polymorphisms
  - Proteomics
  - Metabolomics
- Microbiome:
- Drug Metabolism

DILI Pathogenetic Mechanism(s)
- Host-Drug Transporters
- Metabolism
- PK/PD for Hepatic Dosing:
  - Stages 0-3
  - Cirrhosis
Enrollment of patients with CLDs, with and without cirrhosis, in trials of drug development is increasing due to the rising prevalence of CLDs and cirrhosis:

- general drug development
- disease-specific therapies for all major classes of CLDs
- cirrhosis (antifibrotics) and complications of PVHTN and HCC

In general, CLDs do not increase susceptibility for DILI, but exceptions exist, and more are likely to be discovered.

Subjects with CLDs and low hepatic functional reserves have increased risks of serious DILI and death.

Currently, study protocols provide protection for subjects with CLD from serious DILI by alerting investigators to the need for urgent, comprehensive evaluation of cases meeting Hy’s Law or other criteria and/or exhibiting evidence of decompensated cirrhosis.

Future study protocols should provide additional protection for subjects with CLD by direct quantitative testing of hepatic functional reserve at baseline and during any suspected DILI event, applying biomarkers of DILI and its severity, testing for polymorphisms of UGT1A1, OATP and BSEP to aid in interpretation of abnormal bilirubin and cholestasis and utilizing advanced imaging techniques with the goal of producing better evidence-based stopping rules for patients with CLDs.
